

REVIEW POINTERS, DYNAMIC MEMORY LINKED LISTS

Problem Solving with Computers-II

C++

```
#include <iostream>
using namespace std;

int main(){
    cout<<"Hola Facebook\n";
    return 0;
}
```

Have you implemented a linked-list before?

A. Yes

B. No

Linked Lists

The Drawing Of List {1, 2, 3}

Pointers

- **Pointer:** A variable that contains the address of another variable
- Declaration: `type *pointer_name;`

`int* p; // p stores the address of an int`

What is output of the following code?

`cout<<*p;`

- A. Random number
- B. Undefined behavior
- C. Null value

How do we initialize a pointer?

Review: Pointer assignment

```
int *p1, *p2, x;  
p1 = &x;  
p2 = p1;
```

Q: Which of the following pointer diagrams best represents the outcome of the above code?

C. Neither, the code is incorrect

Review: Pointers to structs

```
Node x = {10, 0};
Node *p = &x;
p->data = p->data + 1;
p = p->next;
```

```
struct Node {
    int data;
    Node *next;
};
```

Q: Which of the following pointer diagrams best represents the outcome of the above code?

A.

B.

C. Neither, the code is incorrect

Create a two node list

- Define an empty list
- Add a node to the list with data = 10

```
struct Node {  
    int data;  
    Node *next;  
};
```

Iterating through the list

```
void printElements(Node* head) {  
    /* Print the values in the list */  
  
  
}
```

Clear the list

```
Node* clearList(Node* head) {  
    /* Free all the memory that was created on the heap*/  

```

```
}
```

Questions you must ask about any data structure:

- **What operations does the data structure support?**

A linked list supports the following operations:

1. Insert (a value)
 2. Delete (a value)
 3. Search (for a value)
 4. Min
 5. Max
 6. Print all values
- **How do you implement each operation?**
 - **How fast is each operation?**

Linked-list as an Abstract Data Type (ADT)

```
class LinkedList {
public:
    LinkedList();           // constructor
    ~LinkedList();          // destructor
    // other methods
private:
    // definition of Node
    struct Node {
        int info;
        Node *next;
    };
    Node* head; // pointer to first node
    Node* tail;
};
```

RULE OF THREE

If a class defines one (or more) of the following it should probably explicitly define all three:

1. Destructor
2. Copy constructor
3. Copy assignment

The questions we ask are:

1. What is the behavior of these defaults (taking linked lists as our running example)?
2. Is the default behavior the outcome we desire ?
3. If not, how should we overload these operators?

Behavior of default

Assume that your implementation of LinkedList uses the default destructor, copy constructor, copy assignment

```
void test_defaults(){  
    LinkedList l1;  
    l1.append(1);  
    l1.append(2);  
    l1.append(5);  
    l1.print();  
}
```

What is the expected behavior of the above code?

- A. Compiler error
- B. Memory leak
- C. Code is correct, Prints 1 2 5
- D. None of the above

Behavior of default copy constructor

Assume that your implementation of LinkedList uses the overloaded destructor,
default: copy constructor, copy assignment

l1 : 1 -> 2 -> 5 -> null

```
void test_default_copy_constructor(LinkedList& l1){  
    // Use the copy constructor to create a  
    // copy of l1
```

```
}
```

- * What is the default behavior?
- * Is the default behavior the outcome we desire ?
- * How do we change it?

Behavior of default copy assignment

Assume that your implementation of LinkedList uses the overloaded destructor, copy constructor, default copy assignment

l1 : 1 -> 2 -> 5 -> null

```
void test_default_1(LinkedList& l1){  
    LinkedList l2;  
    l2 = l1;  
}
```

* What is the default behavior?

Behavior of default copy assignment

Assume that your implementation of LinkedList uses the overloaded destructor, default: copy constructor, copy assignment

l1 : 1 -> 2 -> 5 -> null

```
void test_default_2(LinkedList& l1){  
    // Use the copy assignment  
    LinkedList l2;  
    l2.append(10);  
    l2.append(20);  
    l2 = l1;  
}
```

* What is the default behavior?

Behavior of default copy assignment

Assume that your implementation of LinkedList uses the overloaded destructor, copy constructor, default copy assignment

l1 : 1 -> 2 -> 5 -> null

```
void test_default_assignment(LinkedList& l1){  
    // Use the copy assignment  
    LinkedList l2;  
    l2.append(10);  
    l2.append(20);  
    l2 = l1;  
    l1 = l1;  
}
```

* What is the default behavior?
